Why I created this project

I adore coffee drinks, especially in cafés. This app is designed to help people effortlessly discover and order their coffee beverages from cafés that specialize in high-quality brews.

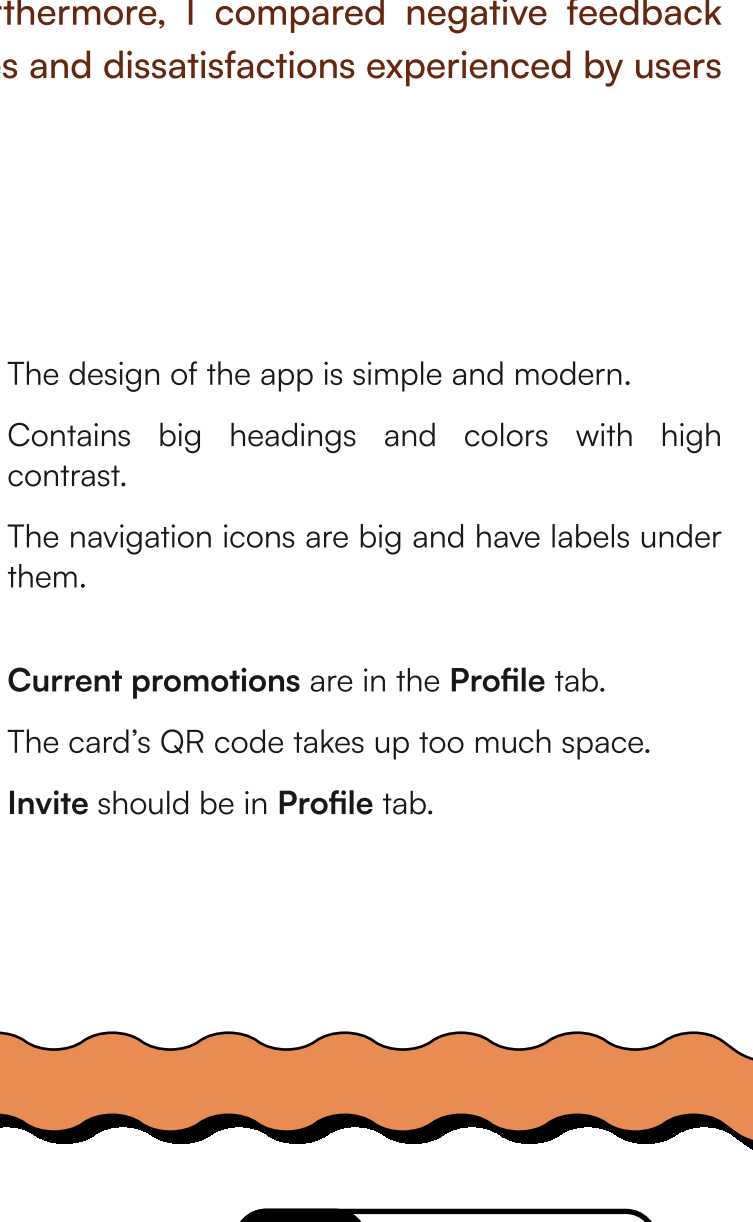

Market Research

The claim

Independent cafés steadily increased their market share from \$42B in 2017, continuing to grow by 2023.

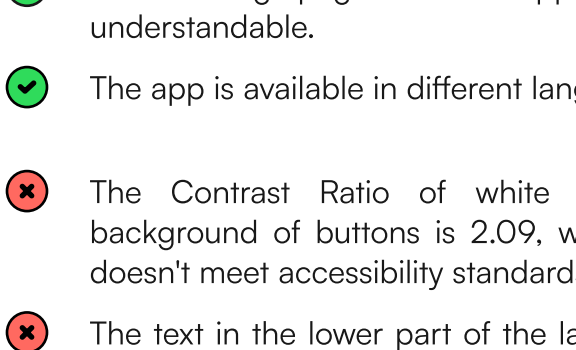

The problem

Independent cafés face tough competition from rapidly expanding major international brands, making it difficult for them to compete.

Competitive analysis

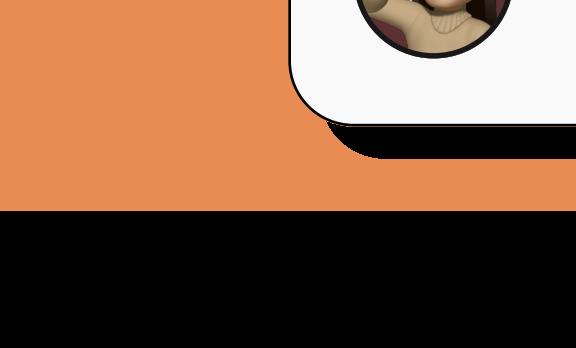

As a part of my analysis, I downloaded and examined three apps. Two of them are my direct competitors and one is indirect. Furthermore, I compared negative feedback from the App Store to identify common issues and dissatisfactions experienced by users while using these apps.

- ✓ The design of the app is simple and modern.
- ✓ Contains big headings and colors with high contrast.
- ✓ The navigation icons are big and have labels under them.

- ✗ Current promotions are in the **Profile** tab.
- ✗ The card's QR code takes up too much space.
- ✗ Invite should be in **Profile** tab.

- ✓ The loyalty card is on the tab bar — it's easy to find it.
- ✓ The landing page of the app is readable and understandable.
- ✓ The app is available in different languages.
- ✗ The Contrast Ratio of white text on a beige background of buttons is 2.09, which means that it doesn't meet accessibility standards.
- ✗ The text in the lower part of the landing page, which informs about how to use the app, is very small and illegible.
- ✗ The main menu contains three unnecessary subsections.

- ✓ Flavors of ice cream in this ice cream shop can be found in the tab bar, so the user can easily find them.
- ✓ The navigation icons are big and have labels under them.
- ✓ The loyalty card also contains its number which can help in case of problems with scanner.

- ✗ The Contrast Ratio of white text on a pink background on top navigation bar is 2.25, which means that it doesn't meet accessibility standards. It also contains a logo-style image that makes it difficult to read

User interview

About the user

 **Name:** Pat
Age: 18
Occupation: High School Student
Location: Gdańsk, Poland

How often do you use café services, and what factors influence your choice of a specific café?

I love drinking coffee, but I don't really know much about it. I visit cafés almost every day. I choose a particular café when they offer daily promotions on the main page of their app and provide a variety of coffee options.

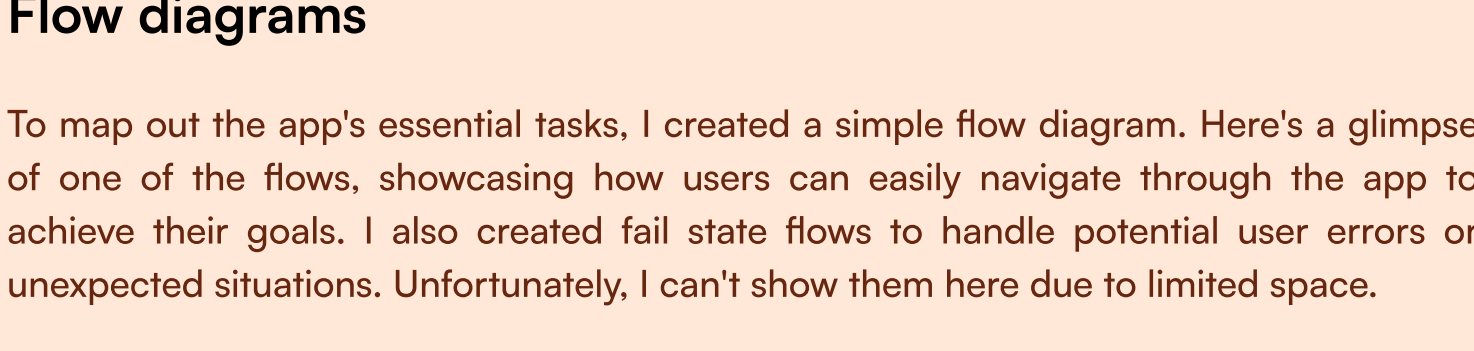

Do you often check for promotions or offers on other platforms like Facebook or Instagram? Do you think it would be more convenient to have this information available in the café's app?

Yes, when there is no dedicated app, I have to search for promotions or offers on other platforms like Facebook or Instagram. It would be more convenient to have all this information in one place, within the café's app.

Do you think a loyalty card would be valuable to you? Do you frequently participate in loyalty programs at cafés?

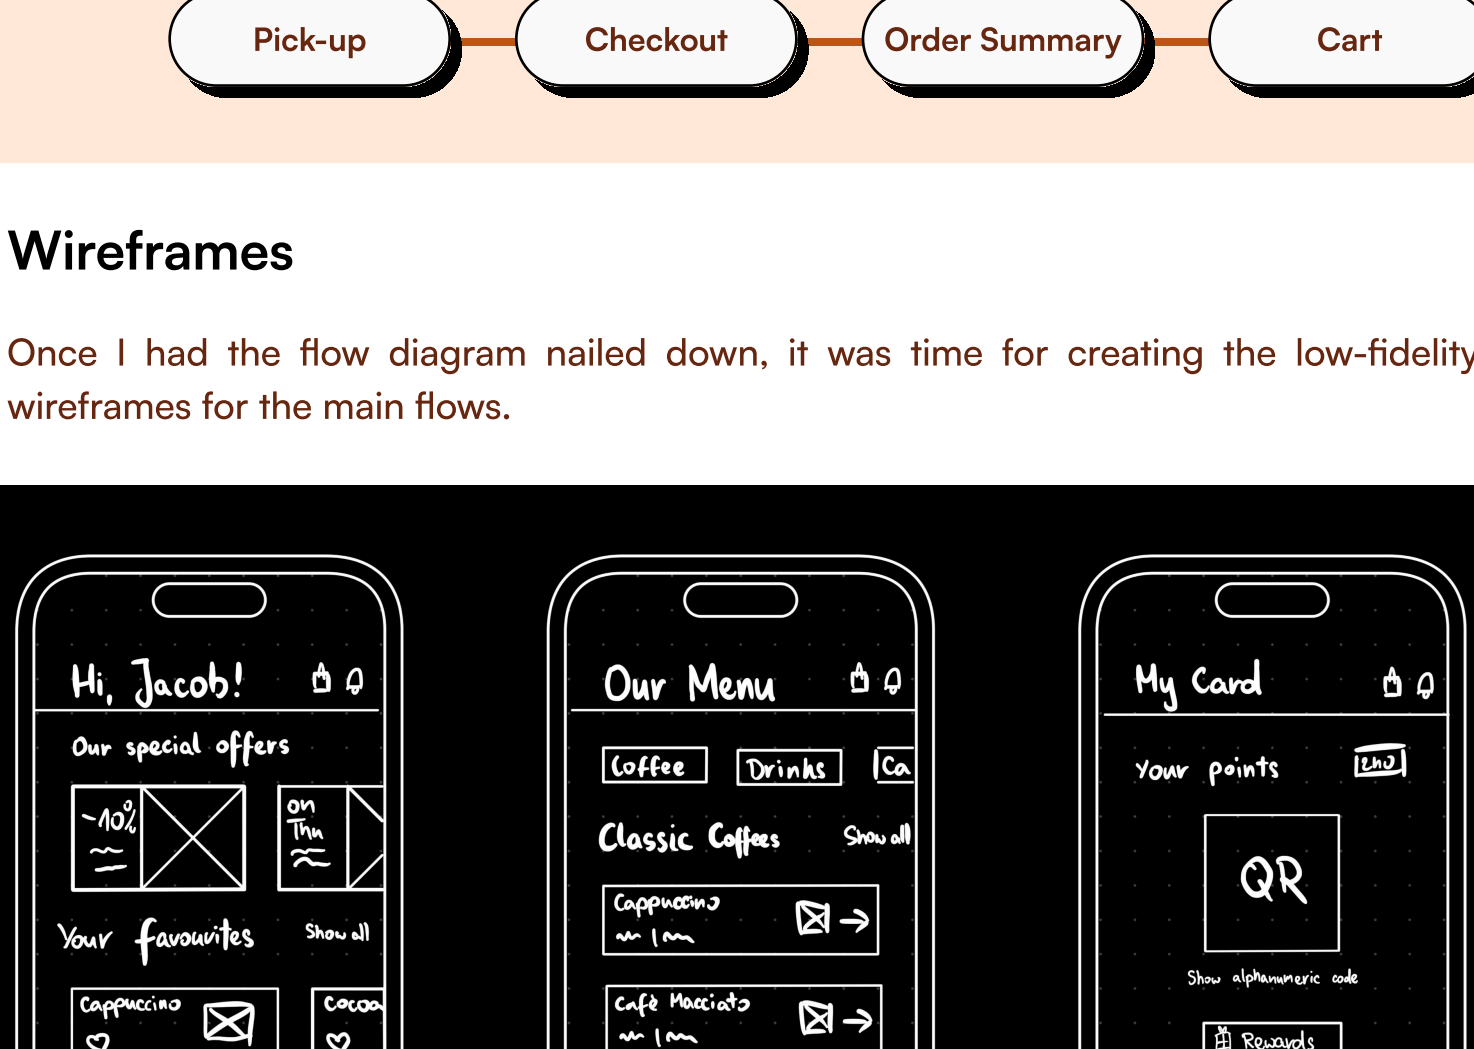

Yes, I believe a loyalty card would be valuable to me. Since I enjoy drinking coffee, but I don't always have enough money for it, a loyalty card could be an additional incentive for me to visit a particular café more frequently and receive discounts or additional benefits.

In this interview, the following information stands out as the most important

Flow diagrams

To map out the app's essential tasks, I created a simple flow diagram. Here's a glimpse of one of the flows, showcasing how users can easily navigate through the app to achieve their goals. I also created fail state flows to handle potential user errors or unexpected situations. Unfortunately, I can't show them here due to limited space.

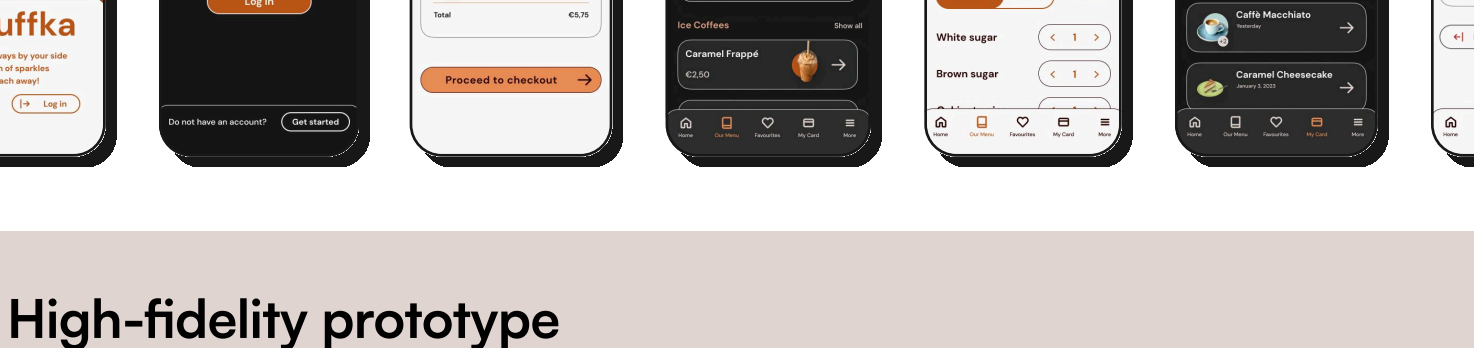

Wireframes

Once I had the flow diagram nailed down, it was time for creating the low-fidelity wireframes for the main flows.

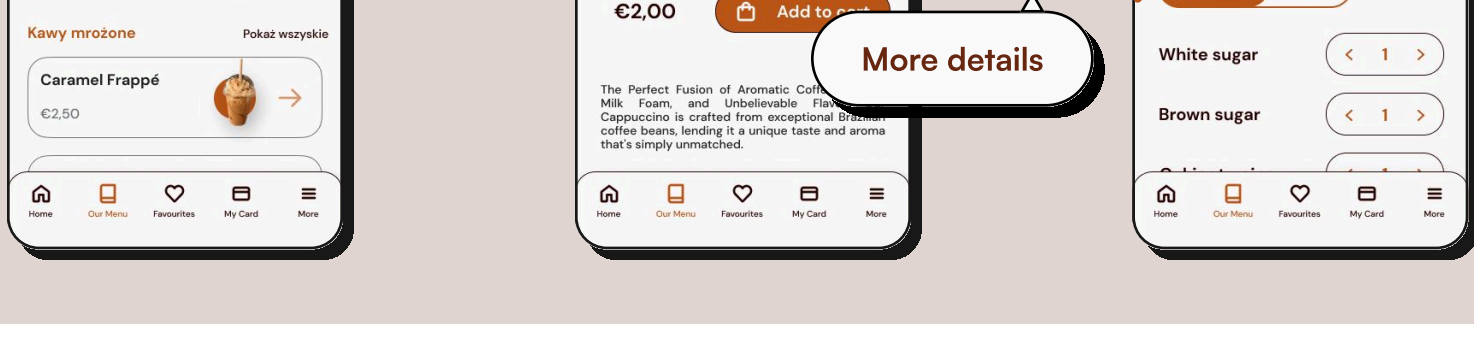

High-fidelity UI

After finalizing the initial flow, I dived right into creating a couple of the app's main screens. To begin, I set the mood by selecting the perfect fonts and colors.

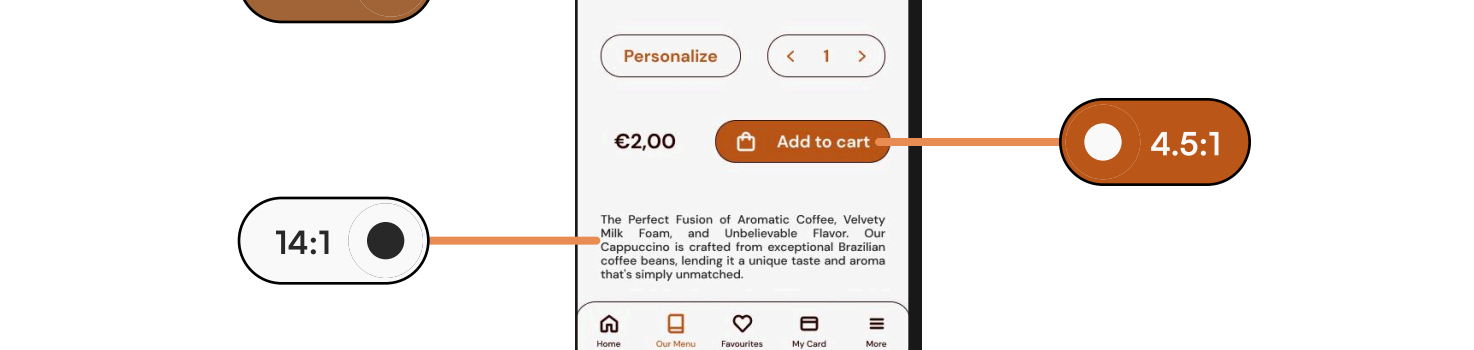

43 high-fidelity designs were created

Including two different app themes — light and dark mode. Users like to have a choice about the appearance of their app.

High-fidelity prototype

I connected my high-fidelity designs into a clickable prototype in Figma. Thanks to this, I can test the app on the first group of users.

Accessibility evaluation

The app has been evaluated for contrast to match at least AA standards. Every frame was checked with contrast checker tools by hand with the "Contrast Checker" by WebAIM.

Project summary

During the project, I managed to evaluate the market research, do a user interview, create a set of lo-fi wireframes, build them into hi-fi UI designs and connect them into a prototype. This was a demanding and time-consuming but very insightful journey. I learned a lot throughout the whole process. There is a lot of room for improvement and many things to learn.
